

INSUFFICIENT EVIDENCE TO RECOMMEND [2016]:

- hyperventilation as temporising measure
- mannitol
- keppra over phenytoin [regarding efficacy in preventing early post-traumatic seizures and toxicity]
- DVT prophylaxis agent/timing/dose

OTHER ASPECTS

- STEROIDS - not recommended for reducing ICP or improving outcome. high dose methylpred contraindicated in severe TBI
- NUTRITION - Feed by day 5. Transgastric jejunal feeding is recommended to reduce incidence of VAP
- SEIZURES - Phenytoin is recommended to increase incidence of early PTS (<7days), although early PTS not a/w worse outcomes
- MANAGE DISORDERS OF SODIUM BALANCE
